Git & GitHub guide

Check email

```
$ git config user.email

or

$ git config --global user.email
```

Change email

```
$ git config user.email "your-new-email@example.com"

or

$ git config --global user.email "your-new-email@example.com"
```

> Without **--global** the email applies to this repository only. With **--global** it applies to every repository on this computer. It sets the email on your commits; it does not change your GitHub account email.

Change branch: main -> feature (new)

```
$ git checkout -b feature
```

GitHub project upload

Method 1

```
1  $ gh auth login
2  $ git init
3  $ git config user.email "your-new-email@example.com"
4  $ git add .
5  $ git commit -m "first commit"
6  $ git branch                                    checking branch
7  $ gh repo create
```

Method 2

```
$ gh auth login
$ git init
$ git add .
$ git commit -m "first commit"
$ git branch -M main                                   sets branch name to main
$ gh repo create <repository-name> --public --source=. --remote=origin
or
   $ gh repo create my-awesome-project -p -s . -r origin
or
   $ git remote add origin https://github.com/your-username/repo-name.git
$ git push -u origin main
```

GitHub repository update

1st step

```
$ gh auth login
```

```
For creating a new repository
$ git init
$ git add .
```

```
For updating an old repository
$ git remote add origin https://github.com/yourusername/your-repo.git
```

2nd step: GitHub project update

Overwrites GitHub with your local copy

```
$ git add .
$ git commit -m "Merge conflict resolved"
$ git push --force origin main
```

Only update, nothing deleted

```
$ git add .
$ git commit -m "Merge conflict resolved"
$ git pull origin main --rebase
$ git push -u origin main
```
